Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /clone_lib="Soares_NFL_T_GBC_S1"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (bases 1 to 427)
                                   ilbrary (UI-R-Y0) was constructed as follows: PCR amplified cDNA inserts from previous library clones from which 3 ESTs had been derived were used as a driver in a hybridization with the normalized whole-eye library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DHIOB bacteria (Life Technologies) to generate the UI-R-Y0 library. This procedure has been previously described
                                                                                                                                                                                                                                              /lab_host="DHIOB (Life Technologies)"
//note="Vector: pT/T3D-Pac (Pharmacia) with a modified note="Vector: pT/T3D-Pac (Pharmacia) with a modified polylinker; Site_I: Not I; Site_2: Eco RI; The UI-R-Y0 library is a subtracted library derived from an individually tagged normalized whole-eye (minus the lens) library. The driver for the subtraction consisted of a pool of all previous libraries (UI-R-AO, UI-R-AI, UI-R-EO, UI-R-EI, UI-R-CO, and UI-R-CO). The tag is a string of UI-R-EI, UI-R-CO, and UI-R-CO). The tag is a string of oligo-of track which allows identification of the library of origin of a clone within the mixture. The subtracted
